Uzair Javaid

FULL STACK & AI ENGINEER

uzair.j1089@gmail.com | github.com/UzairJIqbal | uzairjiqbal.github.io | Pattoki, Punjab, Pakistan (remote)

PROFESSIONAL SUMMARY

Full stack and AI engineer (2 years) who builds and ships live web apps end to end, with five apps live on Vercel. Most recently built Flowlens, which parses real TypeScript codebases into dependency maps, with a tool-calling chat agent that answers only through lookup tools over the parsed graph, measured with evals in LangSmith (70 of 72 answers at mean F1 1.00, zero invented files), and an MCP server for coding agents. Also built VerifAI, a support agent plus an evaluation system with simulated customers, an LLM judge, a hallucination checker and a release gate (89.7% pass rate on the final baseline). Full stack in TypeScript (Next.js, React, Node.js) with PostgreSQL/Supabase, row-level security and Redis. Writes a spec for every phase and reviews every PR. BS Computer Science, graduating 2027. Based in Pakistan, open to remote roles and freelance work.

CORE COMPETENCIES

Full stack TypeScript | MCP servers for agents | LLM evals & judges | AI agents & tool calling | Next.js & React | PostgreSQL & Supabase | Writing specs & docs | Shipping fast, solo

PROJECTS

Flowlens — AI codebase explorer Live

Built solo, end to end: downloads a public GitHub repo, parses every import with the TypeScript compiler API and draws it as an interactive dependency map; an edge exists only when an import resolves to a real file.

Chat agent as a hand-written tool-calling loop (8-round cap, daily limit per organization) that answers only through lookup tools over the parsed graph; evaluated in LangSmith: 70 of 72 answers at mean F1 1.00 with zero invented files.

Grounded AI explanations through one traced client with a per-organization response cache and an automatic check for invented file paths.

Multi-tenant with Clerk organizations and Supabase row-level security on every table, live progress over Supabase Realtime, MCP server for coding agents with hashed, revocable keys; GitHub Actions CI, Content Security Policy, deployed on Vercel.

Next.js 16, TypeScript, Supabase, Clerk, ts-morph, React Flow, Gemini, LangSmith

VerifAI — support agent + evaluation system Live

Customer-support AI agent with 7 tools that check store policy before acting, plus evals: 50 test tasks with a frozen holdout, simulated customers, an LLM judge and a hallucination checker.

Provider pool (Groq first, Cloudflare Workers AI second) on the same model with pacing and automatic failover.

Release gate with a measured noise floor (4.9 points) and a McNemar test on the holdout; final baseline 89.7%, and the gate caught a deliberately broken agent.

TypeScript, Vercel AI SDK, SQLite, Groq, Cloudflare Workers AI, Gemini

NeuraMeet — AI meeting platform Live

Real-time video meetings with AI transcription and meeting intelligence (Gemini, Groq), splitting long meetings into chunks to stay within free-tier API limits.

Guests are created only on the server with permissions enforced server-side; 9 reviewed pull requests with 200+ Vitest tests.

Next.js, React, Node.js, Clerk, Stream, Supabase, Gemini, Groq

Kunji — subscription reseller store Live

Built a live store selling digital subscriptions in PKR: orders, payment receipts, warranty tickets, stock tracking and admin reports with CSV export.

Delivered logins into an encrypted vault where entries can only be created by a database function that checks the order state; Web Push and email alerts for new orders.

Next.js 16, Supabase (RLS, Realtime, Postgres functions), Clerk, Resend, Web Push

DevPulse — GitHub analytics dashboard

Redis sliding-window rate limiting (sorted sets), response caching and scheduled background jobs.

Next.js, GitHub REST API, Upstash Redis, Vercel Cron

EDUCATION

BS Computer Science COMSATS University Islamabad, Sahiwal Campus — Expected 2027

SKILLS

AI Engineering: LLM integration (Gemini, Groq, OpenAI SDK), prompt and context engineering, tool calling, agentic workflows (hand-written tool-calling loops, LangChain), MCP servers, structured LLM outputs, LangSmith tracing and evaluation, hallucination checks, response caching

Backend: Node.js, Express.js, RESTful API design, authentication (Clerk, organizations, multi-tenancy), OAuth and webhooks, Zod

Data: PostgreSQL (Supabase: row-level security, Realtime, SQL migrations, Postgres functions), MongoDB, Redis, Upstash Redis

Frontend: Next.js (App Router, Server Actions), React.js, TypeScript (strict), Tailwind CSS, ShadCN UI, React Flow

System Design: Caching and eviction (LRU/LFU), consistent hashing, CQRS, event-driven architecture, queues and background workers, capacity estimation

DevOps / Tools: GitHub Actions CI, Vercel (Git deploys, Cron, Analytics), Content Security Policy, secrets management, Vitest, pnpm, Git, Claude Code, CodeRabbit
